As a Product Director, Knowledge at Ubisoft Montreal, you will guide the Knowledge stream within the AI Initiatives team. In this role, you will help the organization **make sense of its information ecosystem**, transforming distributed knowledge into **accessible, machine-readable foundations** that support AI-driven products and internal tools. Reporting to the Vice President of AI Initiatives, you will balance **long-term product direction** with **hands-on contribution**, remaining closely connected to the platforms and experiences you help shape.

This is a deeply engaged role. You will work alongside your team to explore ideas, prototype solutions, and learn through experimentation, using modern development practices and AI-assisted tools to ensure the products meet real needs and evolve thoughtfully over time.

What you'll do

- Shape and maintain a **clear product vision and roadmap** for the Knowledge stream, aligned with AI Initiatives priorities
- Support the creation of **knowledge ingestion pipelines** that connect enterprise sources such as SharePoint, Confluence, repositories, databases, and media files
- Enable products that focus on **data extraction, enrichment, classification, and embedding**, turning information into usable knowledge
- Help design **knowledge structures** including graphs, relationships, ontologies, and taxonomies that reflect how information connects across the organization
- Advocate for the **separation of knowledge from presentation**, allowing information to be reused, queried, and rendered across multiple contexts
- Collaborate directly on **prototypes and early solutions**, validating ideas by building and testing practical use cases
- Work in partnership with engineering, platform, security, and data governance teams to **integrate the knowledge layer** responsibly and effectively
- Foster a **supportive, high-trust product and technical environment** that values learning, ownership, and continuous improvement

What you bring to the team

- Experience guiding **complex product platforms**, with comfort moving between strategy and hands-on contribution
- Confidence working with **technical systems, data pipelines, and developer tools** in collaborative settings
- Understanding of **structured and unstructured data** and how knowledge can be represented and connected

- Enjoyment of **building, prototyping, and iterating**, including with AI-assisted development tools
- Ability to communicate complex ideas in **clear, thoughtful, and inclusive ways**
- Experience working across **product, engineering, and governance partners**
- A collaborative leadership approach that encourages participation and shared accountability
- Curiosity, adaptability, and care for both product outcomes and team health

What to send our way

- Your CV highlighting relevant skills and experiences
- Examples of products, platforms, or systems you have helped design, build, or support, such as documentation, demos, repositories, or case studies
